Phase 5: Project Demonstration & Documentation

Title: IOT BASED AQUACULTURE MONITOR

Abstract:

The *Aquaculture Monitor System* project aims to enhance aquaculture management by leveraging IoT (Internet of Things), sensor networks, and data analytics. In its final phase, the system integrates real-time water quality monitoring (e.g., pH, temperature, dissolved oxygen), automated alerts for critical conditions, and secure data visualization for farmers. This document provides a comprehensive report of the project's completion, covering system demonstration, technical documentation, performance metrics, source code, and testing reports. The project ensures scalability and robustness for large-scale aquaculture operations, with features like predictive analytics for disease prevention. Screenshots, system diagrams, and codebase snapshots are included for clarity.

-----Index should be included with page number-----

1. Project Demonstration

Overview:

The Aquaculture Monitor System will be demonstrated to stakeholders, showcasing real-time data collection, alert systems, and user interface functionality.

Demonstration Details:

- **Live Sensor Data:** Display real-time metrics (pH, temperature, dissolved oxygen) from IoT sensors in aquaculture ponds.
- **Alert System:** Demonstrate automated SMS/email alerts for abnormal water conditions (e.g., low oxygen levels).
- **Dashboard Walkthrough:** Show the farmer-friendly dashboard for data visualization and historical trends.
- **Performance Metrics:** Highlight system response time, data accuracy, and scalability under multiple sensor inputs.
- **Security Measures:** Explain encryption protocols for data transmission and storage.

Outcome:

Stakeholders will observe the system's reliability in monitoring aquaculture environments and preventing potential hazards.

2. Project Documentation

Overview:

Comprehensive documentation covers system architecture, codebase, user guides, and testing protocols.

Documentation Sections:

- **System Architecture:** Diagrams of IoT sensor networks, cloud integration, and dashboard workflows.
- **Code Documentation:** Source code for sensor data processing, alert algorithms, and dashboard APIs.
- **User Guide:** Instructions for farmers to interpret data, set alert thresholds, and troubleshoot.
- **Administrator Guide:** Steps for system maintenance, sensor calibration, and data backup.
- **Testing Reports:** Performance evaluations under varying water conditions and load tests.

Outcome:

Clear guidelines for deployment, maintenance, and future upgrades.

3. Feedback and Final Adjustments

Overview:

Feedback from stakeholders and test users will refine the system before handover.

Steps:

- **Feedback Collection:** Surveys and live testing sessions with farmers and aquaculture experts.
- **Refinement:** Adjust sensor accuracy, alert thresholds, or UI improvements based on feedback.
- **Final Testing:** Validate fixes and ensure seamless operation in real-world conditions.

Outcome:

An optimized system ready for field deployment.

4. Final Project Report Submission**Overview:**

A summary of all phases, achievements, and lessons learned.

Report Sections:

- **Executive Summary:** Project goals and key outcomes (e.g., 95% sensor accuracy).
- **Phase Breakdown:** Sensor integration, dashboard development, and predictive analytics.
- **Challenges & Solutions:** Addressing sensor drift or connectivity issues in remote areas.
- **Outcomes:** System readiness for commercial use.

Outcome:

A detailed record for future reference or scaling.

5. Project Handover and Future Works**Overview:**

Transitioning the system with recommendations for expansion.

Handover Details:

- **Next Steps:** Adding multi-pond support, integrating machine learning for feed optimization, or expanding to marine species.

Outcome:

A scalable solution with a roadmap for aquaculture innovation.

Source code and screenshot of final project:

```
#include <Wire.h>
#include <OneWire.h>
#include <DallasTemperature.h>
#include <SoftwareSerial.h>

// Sensor Pins
#define TEMP_SENSOR_PIN 2           // DS18B20 Temperature sensor (1-Wire)

#define TURBIDITY_SENSOR_PIN A2    // Turbidity Sensor (Analog)

// For Serial Communication (UART or SoftwareSerial)
#define RX_PIN 10
#define TX_PIN 11
SoftwareSerial serialMonitor(RX_PIN, TX_PIN); // For Bluetooth/Serial Monitor

// Initialize DS18B20 Temperature Sensor
```

```

OneWire oneWire(TEMP_SENSOR_PIN);
DallasTemperature tempSensor(&oneWire);

// Calibration Values (Adjust based on sensor specs)
float PH_CALIBRATION_OFFSET = 0.0; // Adjust pH calibration
float DO_CALIBRATION_OFFSET = 0.0; // Adjust DO calibration

void setup() {
  Serial.begin(9600); // USB Serial (for debugging)
  serialMonitor.begin(9600); // SoftwareSerial (for Bluetooth/other devices)

  tempSensor.begin(); // Start temperature sensor

  Serial.println("Aquaculture Monitoring System - Initialized");
  serialMonitor.println("Aquaculture Monitoring System - Ready");
}

void loop() {
  // Read all sensors
  float temperature = readTemperature();
  float dissolvedOxygen = readDissolvedOxygen();
  float pHValue = readPH();
  float turbidity = readTurbidity();

  // Print to Serial Monitor (USB)
  Serial.print("Temperature: ");
  Serial.print(temperature);
  Serial.println(" °C");

  Serial.print("Dissolved Oxygen: ");
  Serial.print(dissolvedOxygen);
  Serial.println(" mg/L");

  Serial.print("pH: ");
  .print(pHValue);
  Serial.println(" pH");

  Serial.print("Turbidity: ");
  Serial.print(turbidity);
  Serial.println(" NTU");
  Serial.println("-----");

  // Send data via SoftwareSerial (Bluetooth, LoRa, etc.)
  serialMonitor.print("T:");
  serialMonitor.print(temperature);
  serialMonitor.print(",DO:");
  serialMonitor.print(dissolvedOxygen);
  serialMonitor.print(",pH:");
  serialMonitor.print(pHValue);
  serialMonitor.print(",TURB:");
  serialMonitor.println(turbidity);

  delay(5000); // Wait 5 seconds before next reading
}

// Read Temperature (DS18B20)
float readTemperature() {
  tempSensor.requestTemperatures();

```

```
return tempSensor.getTempCByIndex(0);
}
```

```
// Read Dissolved Oxygen (Analog Sensor)
float readDissolvedOxygen() {
int rawValue = analogRead(DO_SENSOR_PIN);
float voltage = rawValue * (5.0 / 1024.0);
float doValue = (voltage + DO_CALIBRATION_OFFSET) * 2.0;
// Calibration may vary return doValue;
}
```

```
// Read pH (Analog Sensor)
float readPH() {
int rawValue = analogRead(PH_SENSOR_PIN);
float voltage = rawValue * (5.0 / 1024.0);
float pHValue = (3.5 * voltage) + PH_CALIBRATION_OFFSET;
// Calibration needed return pHValue;
}
```

```
// Read Turbidity (Analog Sensor)
float readTurbidity() {
int rawValue = analogRead(TURBIDITY_SENSOR_PIN);
float turbidity = map(rawValue, 0, 1023, 0, 100); // Convert to NTU (0-100)
return turbidity;
```

The screenshot shows the Wokwi IDE interface with an Arduino Uno simulation. The left pane displays the sketch code for an Aquaculture Monitoring System. The right pane shows the simulation output with sensor readings: Temperature: -127.00 °C, Dissolved Oxygen: 5.94 mg/L, pH: 9.09 pH, and Turbidity: 52.00 NTU. The code includes sensor initialization, calibration, and a loop for reading and printing data.

70   delay(5000); // Wait 5 seconds before next reading
71 }

```

Simulation output:

```

Aquaculture Monitoring System - Initialized
Temperature: -127.00 °C
Dissolved Oxygen: 5.94 mg/L
pH: 9.09 pH
Turbidity: 52.00 NTU
-----
Temperature: -127.00 °C
Dissolved Oxygen: 6.30 mg/L
pH: 8.73 pH
Turbidity: 48.00 NTU
-----
